

The *Ingredients* of **Opportunity.**

The truth about formaldehyde, the facts about green

Formaldehyde is a naturally occurring chemical that strengthens the adhesive properties of resins used in many construction materials.

In low quantities, it's absolutely safe. It exists at low levels in our bodies. It's emitted from trees. And it can be found in products we encounter every day, from vaccines to clothing, X-rays to over-the-counter medicines. Our bodies are programmed to process it at these levels.

The *Ingredients* of **Performance.**

**HIGH
PERFORMING**

Arclin has perfected resin technologies that enable us to maintain the strengthening attributes of formaldehyde while keeping emissions at safe levels or eliminating them altogether.

High performing, low impact.

In fact, that can be said of the Arclin's entire suite of **E-Gen™**-designated green products.

**LOW
IMPACT**

That's the impact of our scientific innovation.
